What is Zap?

Zap is the company's **central operations platform** — one place where every team can see what is happening with products, stock, purchase orders, vendors, and warehouses, in real time.

Before Zap, teams relied on spreadsheets, manual downloads from the ERP system, and back-and-forth emails to stay in sync. Zap replaces all of that with a single, fast, access-controlled web application — and a companion mobile app (Zap Ops) for warehouse and field teams.

The problems Zap solves

Challenge	How Zap addresses it
Orders from multiple channels arriving in different formats	One unified view of all purchase orders, searchable and filterable
No team visibility into goods receipt status	GRN status, invoices, and documents visible to all authorised team members
Label printing required a separate external tool	Print-ready barcode labels generated instantly inside Zap
Product catalogues assembled manually in Excel	Structured catalogue builder with one-click PDF or Excel export
New staff overwhelmed by the ERP system	Zap shows each role only what they need, in plain language
Operations dependent on ERP availability	Critical workflows work locally even when the ERP is offline

How Zap connects to eAutomate

Zap works alongside the company's ERP system (called **eAutomate**). The relationship is simple:

```
graph TD; A[eAutomate (ERP reference system)] -- "↓ sync overnight or on demand" --> B[Zap (operations platform)]; B -- "↓ display + action" --> C[Teams (web browser or mobile app)];
```

eAutomate (ERP reference system)
↓ sync overnight or on demand
Zap (operations platform)
↓ display + action
Teams (web browser or mobile app)

eAutomate remains the system of record for vendor and order data. Zap copies and enriches that data into a fast, team-friendly interface. Critical actions such as acknowledging an order or generating labels run entirely in Zap and do not depend on eAutomate being available — reducing operational downtime.

The mobile app — Zap Ops

Zap has a companion **mobile app** for warehouse and field teams. It connects to the same data and enforces the same access controls as the web application, making it easy to check stock, GRNs, or orders from the warehouse floor.

Who Uses Zap?

Zap is built for multiple teams working together across a single shared data platform.

Team	What they do in Zap
Operations / Logistics	Manage inbound goods receipts, track outbound orders, handle consignments and labels
Merchandising / Category	Browse the product catalogue, manage SKU details, build and export catalogues
Warehouse team	View bin placements, check stock levels, use the Zap Ops mobile app
Vendor relations	Keep the vendor directory up to date, view PO history
Finance / Compliance	Download invoices, manage debit and credit notes
Sales / Key Accounts	Monitor order status, build buyer catalogues
Management / Leadership	View KPIs, download reports, monitor overall order status

Getting Started

Accessing Zap

Method	How
Web application	Open your browser and go to the Zap URL provided by your IT team
Mobile app (Zap Ops)	Download from the internal app link or company app store

Log in with your company email address and the password set when your account was created. If you have forgotten your password, use the **Reset Password** link on the login screen.

Finding your way around

The main navigation is on the left sidebar. The items you see depend on your role — not every team member sees every module.

Sidebar item	What it is
Inbound	Vendor purchase orders, goods receipt notes, delivery documents
Outbound	Channel purchase orders, consignments, labels, and reports
Listings	Product catalogue, SKU search, inventory levels
Catalogues	Catalogue builder and branded exports
Labels	Label generation tools
Vendors	Supplier directory
Warehouses	Storage locations and bin management
Forms	Operational checklists
Focus Lists	Your saved product shortlists
Bulk Ops	Mass import and export tools

Quick-start by role

Operations / Logistics: Go to Outbound → Purchase Orders and filter by *Status: Open* to see everything awaiting your attention.

Merchandising / Category: Search for a SKU you know well in the Listings module to see how product data is organised.

Warehouse team: Download the Zap Ops mobile app — it makes warehouse tasks much faster than a desktop browser.

Finance: Go to Inbound → GRNs and filter by *Invoiced but not settled* to see what needs attention first.

Sales / Key Accounts: Create a Focus List with the core SKUs for your most important buyer — it saves time every day.

Roles and Access

Zap uses a **role-based access system**. Every user is assigned a role, and each role grants access only to the features and data that person's job requires. This protects business data, prevents accidental changes, and ensures accountability — every action in Zap is tied to a specific named user.

Think of it like a key-card system in an office building. A warehouse worker's card opens the warehouse and loading bay, but not the finance department. A finance manager can access accounting records, but not the warehouse management console.

Role descriptions

Administrator — Full access to all modules, data, and settings. Can create, edit, and deactivate user accounts, assign roles, and trigger data syncs.

Operations Manager — Full access to inbound and outbound purchase orders, labels, consignments, reports, and vendor data.

Warehouse Staff — Can raise GRNs, view inbound and outbound purchase orders, look up bin locations, and use the mobile app.

Finance / Accounts — Can view GRNs, linked invoices, and debit / credit notes. Can download financial reports.

Merchandising / Category — Can view and edit product listings, build catalogues, export product data, and use bulk import.

Sales / Key Accounts — Can view listings, stock levels, and outbound PO status. Can build catalogues and manage personal focus lists.

Read-Only Viewer — Can view (but not edit) any module they are granted access to. Useful for auditors or senior stakeholders.

Access at a glance

Action	Admin	Ops Mgr	Warehouse	Finance	Merch	Sales
View inbound POs	✓	✓	✓	✓	—	—
Raise GRN	✓	✓	✓	—	—	—
Raise debit / credit note	✓	✓	—	✓	—	—
View outbound POs	✓	✓	✓	—	—	✓
Acknowledge / cancel PO	✓	✓	—	—	—	—
Generate labels	✓	✓	✓	—	—	—
Download reports	✓	✓	✓	✓	✓	✓
Edit product listings	✓	—	—	—	✓	—
Build catalogues	✓	—	—	—	✓	✓
Manage vendors	✓	✓	—	✓	—	—
Bulk import / export	✓	✓	—	—	✓	—
Manage users and roles	✓	—	—	—	—	—

Audit trail

Every action in Zap — raising a GRN, acknowledging an order, editing a product — is logged with the user's name, date, and time. This log is immutable and available to administrators for compliance and audit review.

Inbound Operations

What is “inbound”?

Inbound refers to everything that comes *into* your business from a vendor or supplier — physical goods, invoices, and associated paperwork. Zap’s inbound module covers the full journey from the moment a Purchase Order is sent to a vendor, until the goods are received, verified, invoiced, and settled.

The inbound journey

Step 1 — Purchase Order raised and sent to vendor

Step 2 — Vendor ships goods

Step 3 — Goods arrive at warehouse

Warehouse team creates a GRN in Zap

Quantities and SKUs are checked and entered

Short or damaged items are flagged

Step 4 — Vendor invoice received

Uploaded and linked to the GRN in Zap

Step 5 — Finance reviews

Checks invoice amounts against GRN quantities

Raises a Debit Note if goods are short or damaged

Step 6 — Records closed

All documents visible to authorised team members at any time

Key terms

Term	Plain-English meaning
Purchase Order (PO)	A formal order your company sends to a supplier asking for specific products
GRN (Goods Receipt Note)	A document that confirms what was received, in what quantity, and in what condition
Line item	A single product/SKU entry within the PO or GRN
Invoice	The vendor's bill for the goods supplied
Debit Note	Raised against a vendor when goods are short, damaged, or returned
Credit Note	Raised by the vendor in your favour, reducing the amount owed

Real example — receiving a vendor shipment

You ordered 1,000 units from Vendor A across 5 SKUs. The truck arrives on Thursday.

1. The warehouse team opens Zap and finds the inbound PO for Vendor A.
2. They create a GRN, entering actual quantities received for each SKU.
3. While unloading, they notice 50 units are damaged — recorded in the GRN as a short receipt.
4. The vendor's invoice arrives by email and is uploaded into the GRN.
5. Finance reviews, and because of the 50 damaged units, raises a **Debit Note** for their value.
6. The GRN is marked settled. All records are visible and searchable at any time.

Status flow

Status	Meaning
Open	PO sent to vendor; awaiting delivery
Partially Received	Some goods have arrived; GRN not yet complete
Received	All goods received; GRN complete
Invoiced	Vendor invoice received and linked
Settled	Invoice matched, notes resolved, records closed
Cancelled	PO was cancelled before delivery

Outbound Operations

What is “outbound”?

Outbound covers everything that leaves your warehouse to a sales channel or buyer — from receiving the channel’s purchase order, through packing, labelling, and dispatching the goods. Your sales channels (e.g. Swiggy Instamart, Blinkit, Zepto) place orders for products they want to stock. Zap helps your team receive those orders, fulfil them, and track what has been sent.

The outbound journey

Step 1 — Channel places a Purchase Order

P0 syncs into Zap automatically

Step 2 — Ops team reviews P0 in Zap

Clicks "Acknowledge" – order confirmed as accepted

Status changes to In Progress

Step 3 — Warehouse picks and packs goods

Team uses the P0 detail page in Zap as a picking guide

Step 4 — Consignment created

All boxes going to one destination grouped together

Step 5 — Box labels generated from Zap

Enter box range → download PDF → print, one label per box

Step 6 — Product labels generated if required

Select SKUs → enter quantities → choose label size → download PDF

Step 7 — Goods dispatched

Transport arrives; boxes handed over

Consignment marked as Dispatched in Zap

Step 8 — Reports downloaded for records

SKU Pendency Report filed; any shortfall noted

Key terms

Term	Meaning
Outbound PO	A purchase order received <i>from</i> a sales channel — the channel is buying from you
Acknowledgement	Confirming to the channel that you accept their order and will fulfil it
Consignment	A group of boxes all going to the same destination in one shipment
Box label (Phase 1)	A barcode label on each shipping carton identifying the consignment and box number
Product label	A sticker on individual units showing MRP, barcode, brand, and manufacturer details
SKU pendency	Items in a PO that have not yet been dispatched

Real example — fulfilling a Blinkit order

Blinkit places PO #MBEPO16587 for 2,400 units across 36 SKUs, to be delivered to their Gurgaon warehouse.

Day 1 — Order received: The PO syncs into Zap overnight. The ops manager finds it, clicks **Acknowledge**, and the status changes to In Progress.

Day 2–3 — Warehouse packs: The team uses the PO detail page to pick all 36 SKUs and packs goods into 45 boxes. The ops manager enters box range 1–45 in the **Phase 1 Box Labels** tool and downloads a 45-page PDF — one page per box — printed and attached.

Day 4 — Product labelling: For 8 SKUs requiring unit stickers, the ops manager opens **Generate Product Labels**, selects those SKUs, enters the quantities needed, and downloads the label PDF. Labels are printed and affixed.

Day 4 — Dispatch: The truck arrives, boxes are handed over, and the consignment is marked Dispatched. A **SKU Pendency Report** is downloaded for the records.

PO status flow

Status	Meaning
Open	PO received from channel; awaiting acknowledgement
Acknowledged	Ops team confirmed the order is accepted
In Progress	Warehouse is picking and packing
Ready to Dispatch	All boxes packed and labelled; awaiting pickup
Dispatched	Goods handed to courier or transport
Cancelled	PO cancelled before dispatch

Listings and Inventory

What is “listings and inventory”?

A **listing** is Zap’s record for a single product variant — everything the business needs to know about that product in one place: name, barcode, dimensions, pricing, images, warehouse location, and current stock level.

Inventory refers to the physical stock count — how many units of each product are held in which warehouse or bin.

Together, they give every team a single, reliable answer to: *“What do we have, where is it, and what does it look like?”*

What is stored on each product listing?

Field	What it contains
SKU / Article code	Unique identifier for this product variant
Product name	Full descriptive name including variant
Brand	The selling brand
Category	Where the product fits in the hierarchy
EAN / Barcode	13-digit global barcode for scanning and labelling
MRP	Maximum Retail Price — used on product labels
Dimensions and weight	Used for logistics costing and box planning
Images	Product photographs linked to the listing
Country of origin	Required for legal product labelling
Manufacturer details	Name and address for the product label
Bin location	Which aisle, shelf, and bin in the warehouse holds this SKU
Stock level	Quantity on hand, broken down by warehouse

Understanding stock levels

Zap tracks inventory across multiple warehouses. For each SKU you can see:

- **Quantity on hand** — units physically present in your warehouses
- **Inbound pending** — units ordered from vendors, not yet received
- **Outbound pending** — units committed to channel orders, not yet dispatched
- **Net available** — on hand minus outbound pending

***Example:** SKU A has 500 units on hand, 200 committed to a Blinkit PO, and 100 more arriving from a vendor. Net available = 300 units.*

Real example — looking up a product

A Key Account Manager on a call with a buyer needs the current stock level and dimensions of a kitchen storage set (SKU: KSS-001).

The KAM searches “KSS-001” in the Listings module. Within seconds, the listing shows the product name, images, dimensions, weight, MRP, and current stock per warehouse — all shared with the buyer in under 60 seconds, with no emails or waiting.

Catalogues and Exports

What is the Catalogue module?

The **Catalogue module** allows the team to build structured product catalogues — collections of products organised for a specific purpose, such as a buyer presentation, a seasonal range, or a channel assortment — and export them as a branded PDF or Excel file.

How catalogue creation works

Step 1 — Create a new catalogue

Name it; choose a layout template

Step 2 — Add products

Search listings, select SKUs

Images and pricing are auto-filled from product records

Step 3 — Review and arrange

Reorder items; make any final edits

Step 4 — Export as PDF or Excel

File downloads immediately

Step 5 — Share with the buyer

Email, present in meeting, or share digitally

Real example — preparing a buyer catalogue

The sales team needs 80 home décor products presented to a retail chain buyer.

Normally this takes hours of manual work in Excel or a design tool.

With Zap: the merchandiser creates a new catalogue, adds 80 SKUs (images and prices filled automatically), and clicks **Export to PDF**. A formatted, brand-ready document is ready in seconds.

Label Generation

Product Labels

Product labels are the stickers placed on individual product units before dispatch. They carry legally required information and a scannable barcode that channels use for their inventory systems. Zap generates print-ready label PDFs directly from product listing data.

What appears on a product label?

Field	Source
Product name	Listing
Brand	Listing
MRP	Listing
EAN-13 barcode	Listing (auto-rendered as a scannable image)
Manufacturer name and address	Fixed settings or listing
Country of origin	Listing
Net weight / quantity	Listing

Generating product labels — the 4-step wizard

Step 1 — SKU list: Zap auto-fetches all SKUs for the selected purchase order.

Step 2 — Fixed settings: Confirm or edit the manufacturer name and address — fields that are identical across all SKUs.

Step 3 — Quantities: Enter the number of labels needed for each SKU.

Step 4 — Label size: Choose 70×40mm or 75×38mm based on your printing stock.

Click **Generate** — a multi-page PDF downloads, one label per page, ready for the printer.

Box Labels (Phase 1)

Box labels are applied to the outside of each shipping carton. They identify the consignment, box number (e.g. “Box 15 of 60”), destination, and date of packing, with a scannable Code-128 barcode.

Generating box labels

1. Open the outbound PO in Zap.
2. Click **Generate Phase 1 Box Labels**.
3. Enter the box range (e.g. 1 to 60).
4. Select the label size.
5. Click **Generate** — a PDF downloads with one label per page. Print and attach one to each box.

Label size options

Size	Typical use
70 × 40 mm	Standard product and box labels
75 × 38 mm	Slightly wider labels for certain product categories

Vendors

What is the Vendor module?

The **Vendor module** is Zap’s directory of all suppliers, manufacturers, and trade partners. Every company that sells goods to your business has a live profile here, connecting contact details, purchase history, linked SKUs, and financial notes in one place.

What is stored per vendor?

Field	Contents
Company name	Vendor’s trading name
Contact person	Primary point of contact
Phone and email	Communication details
Address	Billing and shipping address
GST / Tax ID	For invoicing and compliance
Linked SKUs	Products this vendor supplies
PO history	All inbound POs placed with this vendor
Payment terms	Net-30, Net-60, etc.

Real example

Finance needs the GST number and address of Vendor X to raise a debit note.

Open the Vendors module, search the vendor by name — the record appears instantly with GST number, full address, and contact details. No chasing emails. No outdated spreadsheets.

Warehouses and Storage

What is the Warehouse module?

The **Warehouse module** provides a structured map of all physical storage locations — down to the individual **bin** level. A bin is the smallest identifiable unit of storage inside a warehouse (e.g. “Aisle B, Shelf 3, Right position = B-03-R”).

Why it matters

Without structured bin locations	With Zap warehouse bins
“It’s somewhere in the back”	“SKU XYZ is in Bin B-03-R, Warehouse Pune”
New staff take weeks to learn the floor	Search by SKU → bin location shown instantly
Stock counts require walking the entire floor	Count one specific bin to reconcile one SKU
Mis-picks causing wrong-item shipments	Confirm bin before picking every time

Real example

A warehouse worker needs to pick 50 units of a cleaning product for an urgent outbound order.

The supervisor searches the SKU in Zap and sees: “Bin C-07-L, Warehouse Mumbai — 280 units available.” The worker walks directly there. No searching. No delay.

Forms and Checklists

What are Forms?

Forms are digital checklists that teams fill in as part of regular operational tasks. They replace paper and spreadsheet checklists with tracked, searchable digital records — including who completed the form and when.

Common uses: daily warehouse opening checklists, pre-dispatch quality checks, incoming goods inspection reports, and cold-chain compliance sign-offs.

Real example

Before 60 boxes leave the warehouse, a supervisor must complete a pre-dispatch quality check.

The supervisor opens the “Pre-Dispatch QC” form in Zap, ticks each checkpoint (box sealing, label presence, etc.), and flags any issues. On submission, the form is saved against the consignment with the supervisor’s name and timestamp. If an issue was flagged, the dispatch is held until it is resolved.

Focus Lists

What is a Focus List?

A **Focus List** is a personally curated shortlist of products that a team member wants to track closely — similar to a favourites or watchlist. Add the SKUs you care about most, and they are always one click away.

Useful for category managers tracking a specific range, account managers watching a buyer's assortment, or operations teams monitoring SKUs with recurring stock issues.

Real example

An account manager handles the Zepto account. Zepto stocks 120 SKUs but 15 are high-velocity and need daily attention.

The account manager creates a Focus List called “Zepto — Core 15” and adds those 15 SKUs. Each morning, they open this list instead of searching the full catalogue and see stock levels, pending inbound, and any flags for all 15 products at a glance.

Bulk Operations

What are Bulk Operations?

Bulk Operations allow team members to create, update, or export many records at once — rather than editing them one by one.

Common uses

Task	How Bulk Ops helps
Onboarding new products	Upload hundreds of new SKUs via spreadsheet
Price updates	Update MRP or cost price for many SKUs in one step
Bin location changes	Reassign multiple SKUs after warehouse reorganisation
Export for reporting	Download a full filtered product set for analysis
Stock count upload	Upload physical count results to reconcile stock levels

How bulk import works

Step 1 — Download the official Zap template

Ensures your file has the correct column structure

Step 2 — Fill in the template

One row per SKU or record

Step 3 — Upload the file

Zap validates every row before saving anything

Step 4 — Review errors

Fix any flagged rows; re-upload if needed

Step 5 — Confirm import

All valid rows processed in one step

Step 6 — Download the import summary

Shows rows succeeded, skipped, or failed

Important: Always use the official Zap template. Zap validates every row before committing — if an import fails, existing data is untouched. All imports are logged with the user's name and timestamp.

End-to-End Workflows

This section describes the five most important processes that Zap supports from start to finish.

Workflow 1 — Vendor Order to Stock Receipt

When your company orders products from a supplier and receives them at the warehouse.

Teams involved: Procurement → Vendor → Warehouse → Finance

1. Procurement raises a Purchase Order
Sent to vendor; PO record synced in Zap
2. Vendor ships the goods
3. Goods arrive at your warehouse
Warehouse team raises a GRN in Zap
Quantities entered per SKU; short or damaged items flagged
4. Vendor invoice received
Uploaded to the GRN and linked to the PO record
5. Finance reviews
Checks invoice amounts against GRN quantities
Raises a Debit Note if goods are short or damaged
6. Stock levels updated in Zap
Bin location recorded for each received SKU
7. PO marked settled
All records closed and fully searchable for audit

Workflow 2 — Channel Order Fulfilment

When a sales channel places an order and you pick, pack, label, and dispatch it.

Teams involved: Channel → Ops team → Warehouse → Dispatch

1. Channel places Purchase Order
PO syncs into Zap; appears in Outbound POs list
2. Ops team acknowledges the order
Status changes to In Progress
3. Warehouse picks and packs goods
Team uses PO line items in Zap as a picking guide
Goods packed into numbered boxes
4. Box labels generated from Zap
Enter box range → download PDF → print one label per box
5. Product labels generated if required
Select SKUs → enter label quantities → choose size → print
6. Goods dispatched
Transport arrives; boxes handed over
Ops team marks consignment as Dispatched in Zap
7. SKU Pendency Report downloaded
Filed for records; any shortfall noted for follow-up

Workflow 3 — Catalogue Creation and Sharing

When the sales team needs a formatted product catalogue for a buyer meeting.

Teams involved: Merchandising / Sales → Catalogue module → Buyer

1. Merchandiser creates a new catalogue in Zap
Names it; selects a layout template
 2. Adds products
Searches listings; images and pricing auto-filled
 3. Reviews content
Reorders items; makes final edits
 4. Exports as PDF or Excel
Downloads immediately
 5. Shares with buyer
Email, printed copy, or digital
-

Workflow 4 — New Vendor Onboarding

When the company starts working with a new supplier for the first time.

Teams involved: Procurement → Vendors module → Merchandising

1. Procurement agrees terms with the new vendor
2. Vendor record created in Zap
Company name, address, GST number, contact, payment terms
3. New SKUs linked to the vendor
Listings created with manufacturer and origin details
4. First Purchase Order raised
GRN will be raised on delivery
5. Labels and catalogue pages immediately available
Because the listing is complete from day one

Workflow 5 — Stock Reconciliation

When the team needs to verify that physical stock matches system records.

Teams involved: Warehouse → Operations → Finance

1. Warehouse team conducts physical count
Counts units in each bin, SKU by SKU
2. Count results entered into Zap bulk import template
One row per SKU
3. File uploaded via Bulk Operations
Zap compares physical count vs system quantity
Discrepancies flagged automatically
4. Discrepancies reviewed
Each flagged SKU investigated
Cause identified (unlisted dispatch, damage, counting error, etc.)
5. Adjustments recorded in Zap
Each correction logged with reason and user's name
6. Reconciliation report downloaded
Filed for audit; complete record of the count and all adjustments

How all modules connect

No module is isolated — they all share the same underlying product and stock data, ensuring that every team is always working from the same source of truth.

Contact and Support

Need	Who to contact
Account or login issue	IT / System administrator
Training on a specific module	Operations manager or team lead
Reporting a system error	IT helpdesk or the Zap support channel
Requesting a new feature	Product owner or operations manager
API access or integrations	IT / System administrator
